

## Summary

A biotechnological method is described for preparing compounds of the general formulas

wherein  $R^1$  is acyl or acyloxy and  $R^2$  is a hydrogen atom or  $C_{1-10}$  alkyl, comprising the conversion of a lactam of the general formula

by means of a hydrolase in the presence of a nucleophile and in the presence of a base in a constant pH range.

Also described is the subsequent conversion of the compound of general formula I into the optically active 1-amino-4-(hydroxymethyl)-2-cyclopentene of the formula
